

Since UDB does not have any influence on the quality or content of public registers/sources, we are not capable of handling possible queries/complaints with regards to privacy laws substantively, but are only able to direct you to the responsible source or client.

Our clients are mainly based in the credit management industry and they use our services to calculate credit risks, support collection procedures, signalling fraud and other kinds of criminal activities.

In principle we count on the good faith of our clients. Should we however suspect or know about any abuse, UDB will immediately block all access to the system.

Universal Databrokers

Universal Databrokers (UDB) is an international information bureau. UDB makes data on companies, people and addresses from 8 different countries accessible. UDB makes these data available in various ways.

UDB's management has been active in the information industry since 1982. We have extensive international experience in the area of data management. In 2007 this led to the establishment of UDB as an independent and mostly 'virtual' data company, merely aimed on the large-scale processing of data.

Intended purpose

The intended purpose of our products/services is enabling our clients to minimise credit risks, optimise the collection results and segment client-/collection-/credit-/marketing portfolios as well as signalling fraud and other forms of criminal activities. We have official (bulk) user-licenses of mainly large public sources/registers, like: company data from the Chamber of Commerce/Companies

House, real estate from the Cadastre, bankruptcies/debt restructuring, relocation data, telephone numbers/addresses, etc.

Scope

What makes UDB stand out, is the fact that we only do what we are good at: large-scale data unlocking and the processing of various data.

Our international team of software developers has created one large virtual database where all data is accessible in an identical and standardised manner. The data is available at a personal-/company- or address level in any required combination or composition. The UDB database now consists of extensive worldwide information on over 150 million people, 30 million companies, 80 million addresses and 140 million telephone numbers. Best represented are the countries of Belgium, the Netherlands, Germany, the United Kingdom, Austria, Switzerland and Aruba. Our ambition is to also add Italy and Spain to our system.

Long history

All systems are available in real-time and the data are currently available in all conventional languages. To be able to predict the behaviour

of people or businesses, you need to have access to an extensive history. UDB has extensive access to relevant historical data needed to make a good estimation of future payment-/claim- and performance behaviour.

Privacy

UDB is a support service which acquired beneficial bulk-use data licenses for access to public sources. These data are available for the purpose of credit management and if commissioned by third parties adaptations can be made on the acquired data. The UDB-system is capable of consulting dozens of sources within seconds and process these into a report or score.

The results are not saved by us, UDB does not hold the proprietary rights of the acquired and processed data.
